

## WebSphere : Connectivité et Intégration

→ Architecture de l'ESB  
*Concepts, Requirements, Standards*

*Jean-François GONGUET - Software IT Architect - Geneva*

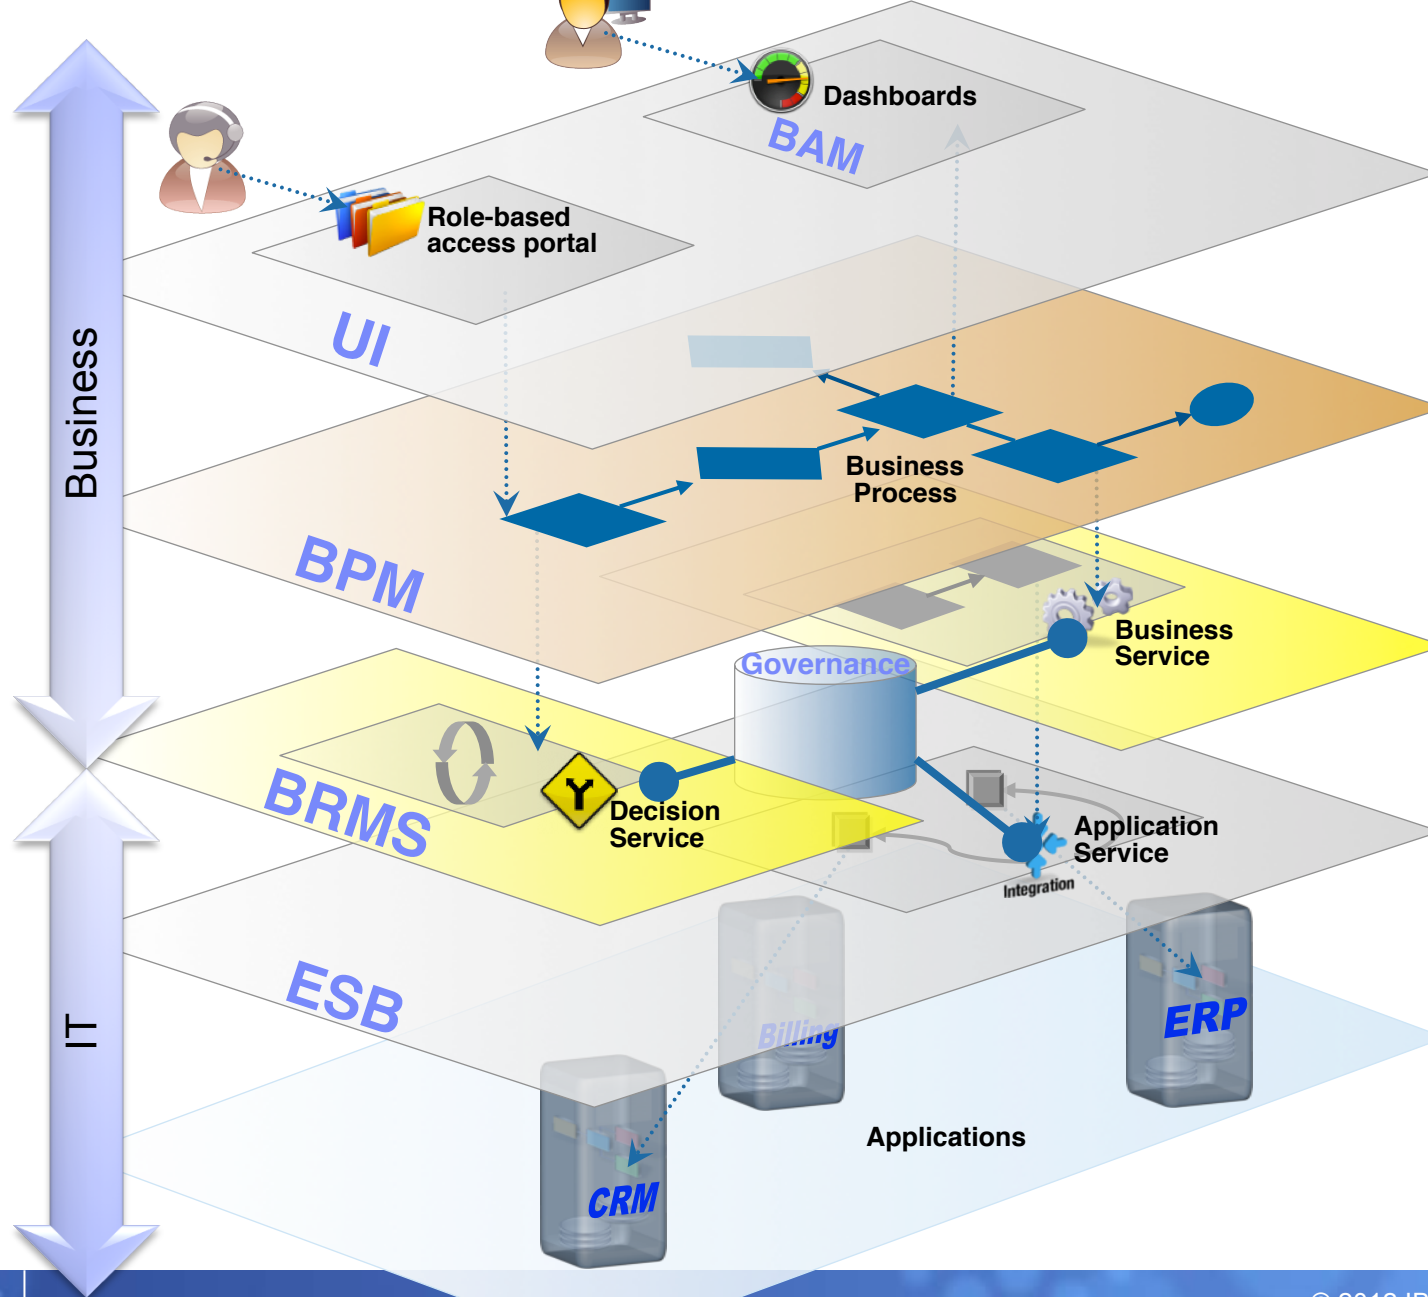

## ESB – Concepts

### ■ SOA – BPM – ESB

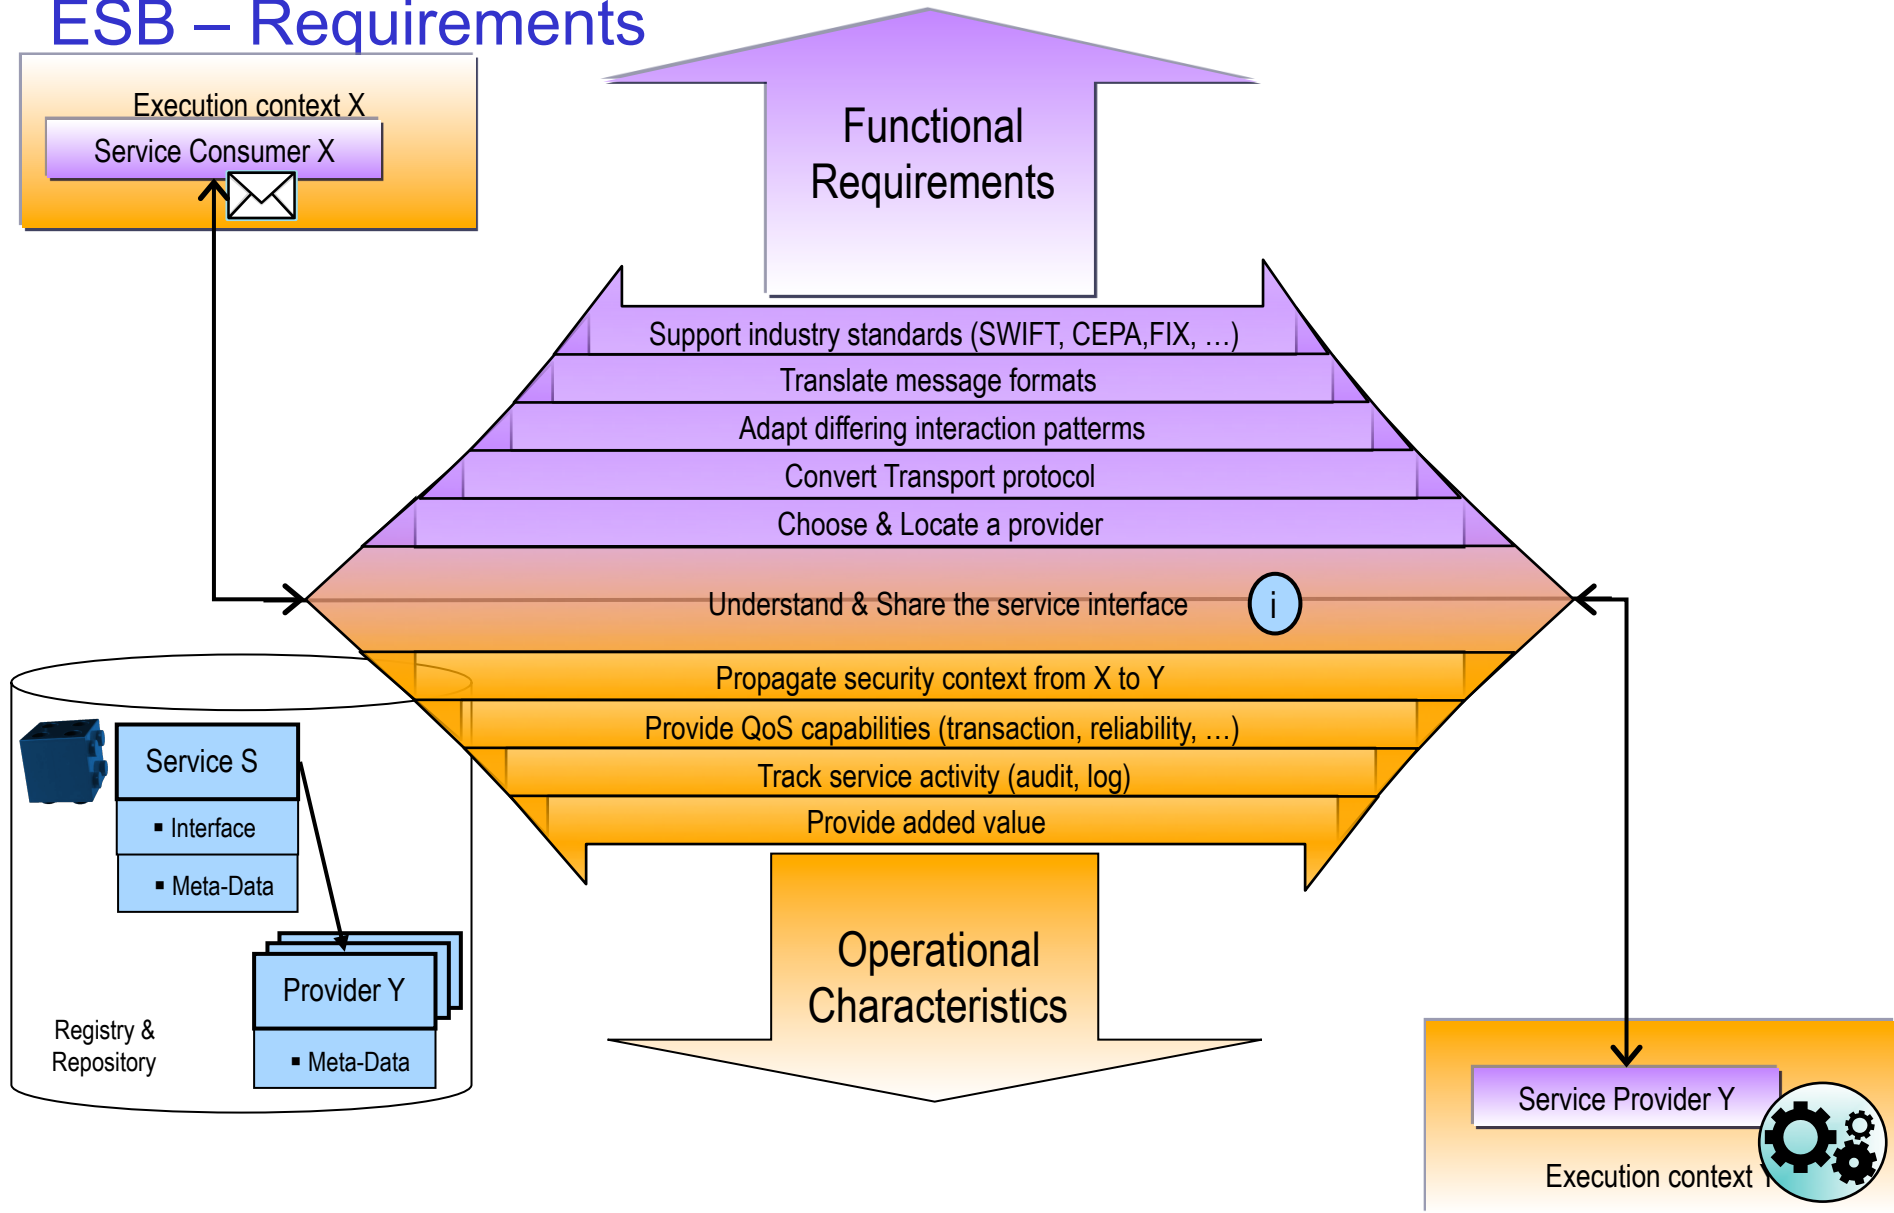

- SOA : software model in which the concept of a **SERVICE** is an **abstraction of a function** used by an application.
- SOA addresses the business demand for applications to be responsive to business needs and to adapt to dynamic business environments.
- BPM : end-to-end process management. Facilitates Business **innovation**.
- Service choreography provides **flexibility** in BPM.
- BAM gives control on business process vitality. Quickly identify problem areas and help to take **actions**.
- ESB : vital ingredient of the SOA environment.
- Decouples Service Requester from Service Provider (hides complexity).
- **Mediates** between service characteristics and service expectations :
  - Mediation functional requirements : service virtualization
  - Operational characteristics : aspect oriented connectivity

## IBM SOA Reference Architecture

# ESB – Requirements

- **Mediation functional requirements**
  - Interface
    - Handles service interface differences
    - Translates message formats
    - Supports industry standards
  - Interaction pattern and communication protocol
    - Handles service interaction differences
    - Converts transport protocols
    - Adapts differing interaction patterns
  - Identity
    - Hides service identity and location
    - Determines appropriate service from candidate providers
    - Routes messages between requester & provider

## ESB – Requirements

### ■ Operational characteristics (NFRs)

- ESB provides **expected** operational aspects defined in the interaction such as :

- Security
- Management
- Logging
- Auditing

that are required in an enriched business environment.

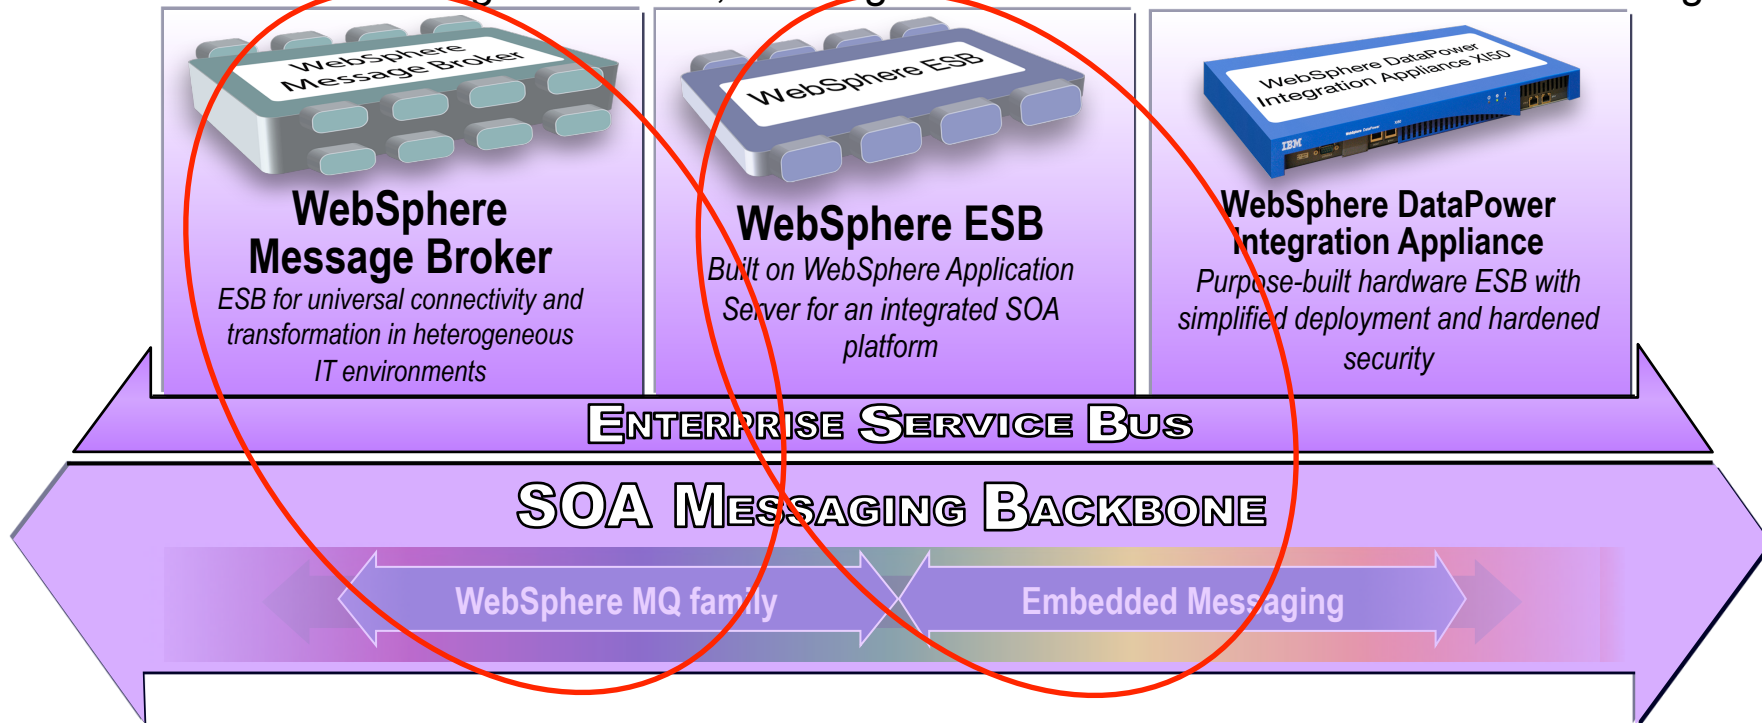

- ESB can also provide added value to interactions without changing the provider and requester themselves :
  - Security re-enforcement
  - SLA : retry failed interaction
  - ...

## ESB – IBM solutions

- ESB layer builds upon Messaging Backbone
  - Adds “awareness” of what messages contain backbone
  - Adds message mediation, message transformation and content-based routing

- Messaging Backbone provides underlying transport layer for Enterprise Service Bus and BPM
  - Provides transport services for ESB family and extends its reach
